

A brief guide to the UK public finances

Office for
**Budget
Responsibility**

THE independent **Office for Budget Responsibility** was established in 2010 to monitor the public sector's finances. Twice a year – alongside each Budget and Spring Statement – we produce detailed forecasts for the coming five years, assessing the likely impact of any policy decisions and expected developments in the economy. We then use these forecasts to assess the Government's performance against the fiscal targets that it has set itself for the management of the public finances.

This guide provides a brief introduction to the UK public finances and to the terms used to describe them in the official statistics. In doing so we are looking at the finances of the public sector as a whole – which encompasses not just central government, but also the devolved administrations, local councils and public corporations. The figures presented in this guide are taken from our March 2019 forecast, which covers the five fiscal years up to 2023-24. Each fiscal year runs from April to March.

Overview

In each forecast we assess how the public finances are likely to evolve on the basis of existing Government tax and spending policies and our best guess at the likely evolution of the economy. In particular we try to estimate:

- **How much money the public sector will raise** from taxes and other sources of revenue. In 2019-20, we expect it to raise £811.4 billion, equivalent to around £28,000 per household or 36.9 per cent of national income.
- **How much it will spend** on things like public services, state pensions and debt interest. In 2019-20, we expect it to spend £840.7 billion, equivalent to around £29,000 per household or 38.2 per cent of national income.

- Whether it will spend more or less than it raises – in other words **whether it will run a budget deficit or surplus**. In 2019-20, we expect a deficit of £29.3 billion. Because receipts are forecast to rise a little faster than spending in future, we expect the deficit to get smaller over time, and reach £13.5 billion in 2023-24. We do not expect to see a surplus in the next five years.

Spending and receipts in 2019-20

- **How much will be added to – or paid off – the national debt** in each year. Debt peaked in 2016-17 at 85.1 per cent of national income – the highest ratio since the early 1960s. (Net debt was less than 40 per cent of national income prior to the financial crisis.) In 2019-20, we expect debt to be equivalent to 82.2 per cent of national income – which is around £1,840 billion or £64,000 per household. As the deficit shrinks, we expect the ratio of net debt to national income to fall year by year and to reach 73.0 per cent in 2023-24. In cash terms we expect it to stand at £1,878 billion by then.

Income

In 2019-20, we expect the public sector's income to amount to £811.4 billion, equivalent to £28,000 per household or 36.9 per cent of national income. These are called 'public sector current receipts' in the official statistics and come from many sources. Taxes are the most important at 93 per cent of the total in 2019-20. The taxes that bring in the most money are income tax and National Insurance contributions, which together are expected to raise around £340 billion. Value added tax (VAT) is the next most important, expected to raise £137 billion. Other big taxes include corporation tax, council tax, business rates and fuel duty. No other tax is expected to raise more than £20 billion.

Sources of public sector receipts

Source: OBR

2019-20

The public sector also receives other revenues, including interest earned on its assets (such as foreign exchange reserves and student loans), while public corporations generate some income.

Over the next five years, we expect total receipts to rise by 19 per cent, which is similar to the growth in the cash size of the economy. We expect some taxes to rise more quickly, including capital gains tax (driven by asset markets, like housing and the stock market) and income tax (as earnings growth leads to more income being taxed at the higher rates). But some tax receipts are expected to rise more slowly than the economy as a whole, including corporation tax (where the tax rate is being reduced over time), fuel duty (because cars are becoming more fuel efficient) and tobacco duty (because people are smoking less).

Spending

THE public sector raises money in order to spend it, mostly on the day-to-day costs of providing public services, on capital investment and on cash transfer payments that support the incomes of various individuals and families.

Public sector spending

Source: HMT, OBR

In 2019-20, we expect public spending to amount to £840.7 billion, which is equivalent to around £29,000 per household or 38.2 per cent of national income. This is called 'Total Managed Expenditure' and covers many different types of spending.

In 2019-20, we expect central government departments to spend £312.2 billion on the day-to-day ('current') running costs of public services, grants and administration. This is 37 per cent of public spending. The biggest items are health (£130.1 billion), education (£63.5 billion) and defence (£29.0 billion). This spending is subject to multi-year limits set by the Treasury – known as 'Resource Departmental Expenditure Limits' or 'RDEL'.

We also expect the public sector to spend £88.1 billion – around 10 per cent of the total – on capital investment (such as roads and buildings). Around 70 per cent of this

will be spent by government departments, again subject to multi-year Treasury limits – 'Capital Departmental Expenditure Limits' or 'CDEL'. Most of the remainder will be carried out by local authorities (mostly roads, schools and housing) and public corporations (like Transport for London).

The Government set out detailed department-by-department plans for RDEL and CDEL in its 2015 Spending Review. This set RDEL plans for all departments out to 2019-20 (and to 2020-21 for some) and CDEL plans out to 2020-21. The NHS settlement

announced in June 2018 means NHS plans currently run to the end of the forecast period.

The biggest component of AME is cash transfers through the welfare system, which we expect to cost £227.3 billion in 2019-20. Around 56 per cent of these transfers are paid to pensioners, with state pensions the largest item at an expected £101.3 billion. Other big items include personal tax credits (£24.8 billion, mostly paid to people of working age) and housing benefit (£23.4 billion, around three-quarters paid to people of working age). Jobseekers' allowance and the equivalent support in the new universal credit – paid to the unemployed – is expected to cost just £2.5 billion.

Interest payments on the national debt are expected to cost £51.1 billion in 2019-20. This includes the interest government pays to private sector holders of the bonds it issues – known as 'gilts' – and also the interest paid by the Bank of England on the money created during the 'quantitative easing' of monetary policy after the late 2000s financial crisis and recession and again since August 2016.

Public spending to 2023-24

Source: OBR, HMT

Over the next five years, we expect public spending to rise by 18 per cent in cash terms – slightly more slowly than the economy will. This is based on the provisional plans for departmental spending set out in the Spring Statement and our forecast for AME.

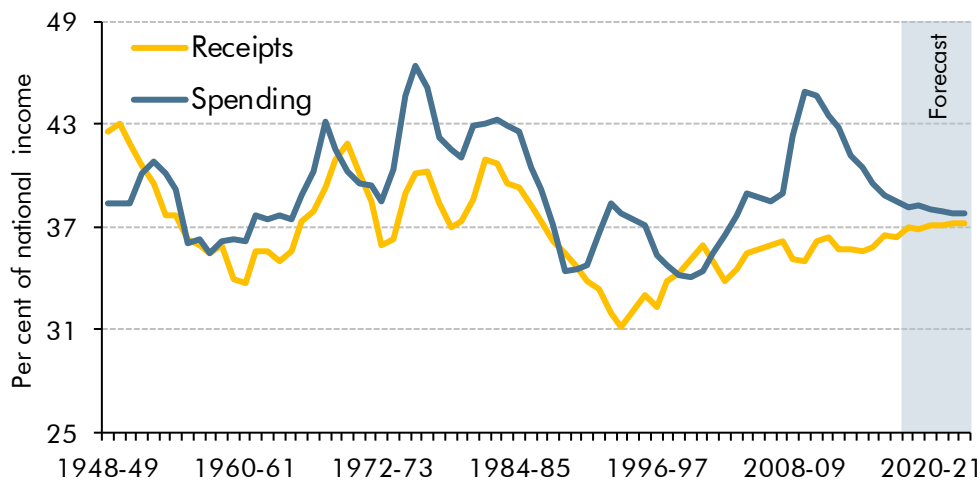

We expect AME to rise by 12 per cent. Spending on some items rises more quickly (e.g. the cost of state pensions as ageing increases the number of pensions in payment and the triple-lock increases the amount); on other items it rises more slowly (e.g.

working-age welfare spending, where the amounts paid to recipients are currently frozen in cash terms). The Government's multi-year spending plans mean that RDEL will rise by 21 per cent in cash terms by 2023-24, so it will rise by 0.3 per cent of national income.

Deficits or surpluses

WHEN total spending in a year is higher than total receipts, the Government needs to borrow to cover the difference. This gap is known as the budget deficit or 'public sector net borrowing'. When receipts are higher than spending, the government runs a surplus. Deficits and surpluses are similar to losses or profits for a company.

The gap between receipts and spending

Source: ONS, OBR

In 2019-20, we expect a deficit of £29.3 billion or 1.3 per cent of national income – down from its post-war peak of £153.1 billion or 9.9 per cent of national income in 2009-10. We expect receipts to rise faster than spending in the

coming years, so we forecast that the deficit will get smaller. But we do not expect the budget to be in surplus at any point in the next five years. By 2023-24, we expect the deficit to have fallen to £13.5 billion, by when receipts would be 37.2 per cent of national income and spending 37.8 per cent.

Swings into deficit have become steadily more pronounced over the post-war period. And budget surpluses have been achieved in only 12 years since 1948 and only five years since 1971-72.

Public sector budget deficit since 1948 (Public sector net borrowing)

Source: ONS, OBR

Movements in the budget deficit are in part the result of the ups and downs of the economy. When the economy is strong, the deficit will be lower as taxes flow in and welfare spending costs are reduced. The opposite is true when the economy is weak.

The 'structural' budget deficit is an estimate of how large the deficit would be if the economy was operating at a normal, sustainable level of employment and activity. We never know precisely what this 'normal' level would be, so these estimates are always uncertain. We currently estimate that the economy will be 0.1 per cent below normal capacity in 2019-20. So we judge that the structural deficit is almost the same as the overall deficit, with virtually no 'cyclical' part of the deficit that would disappear automatically as the economy returns to a normal level of activity.

The headline deficit is the difference between total receipts and total spending, but people are also interested in the 'current deficit' (or surplus). This counts all receipts and all current spending, but excludes spending on net investment. As long as net investment is positive, the current deficit will be smaller than the overall deficit. We expect the current surplus to be £17.7 billion in 2019-20 and for it to reach £40.3 billion in 2023-24.

Public sector net borrowing

Current budget balance

Source: ONS, OBR

So far we have been looking at the flows of spending and receipts that take place each year and the deficits and surpluses they result in. But because governments run deficits much more often than they run surpluses, they have built up a significant stock of outstanding debt over time.

Generally speaking, if the public sector runs a deficit in a particular year, debt will rise in cash terms. But it can still fall as a share of national income if the cash size of the economy is growing sufficiently strongly. (That said, it is also important to be aware that some government activity adds to its debt without adding to the deficit in any given year, most significantly providing loans to students where the loans themselves are financial assets for the government.)

The most widely watched measure of debt in the UK is 'public sector net debt', which subtracts the relatively small amount of assets that the Government could readily turn into cash if required (for example, foreign exchange reserves) from the gross total. Public sector net debt peaked relative to national income in 2016-17 at 85.1 per cent and we expect it to fall to 82.2 per cent in 2019-20 which is equivalent to around £1,840 billion or £64,000 per household.

One of the Government's fiscal targets is to make sure that debt is falling relative to national income in 2020-21, thereby beginning to reverse the big increase associated with the recession and financial crisis. We expect that target to be met, with debt falling from 2017-18 onwards and reaching 73.0 per cent by 2023-24. In cash terms, we expect debt to stand at £1,878 billion in 2023-24.

International comparisons

HOW do the public finances in the UK compare to those in other countries? To answer this question we can look at the forecasts for 32 industrial countries produced by the Organisation for Economic Cooperation and Development (OECD) in November 2018. Unfortunately, the OECD forecasts are not directly comparable with the ones that we have presented so far: for example, the OECD does not cover public corporations, while it defines spending and revenue somewhat differently.

That caveat aside:

- The UK government raises somewhat less revenue relative to national income than the majority of other industrial countries – more than the US, Japan and Korea, but less than Scandinavian countries like Finland and Norway.
- Public spending as a share of national income in the UK is close to the average of other industrial countries – the UK spends much more than the US and Korea, but much less than Finland or France.
- Spending close to the international average, but at the same time raising less in revenue, leaves the UK running a budget deficit that's larger than the industrial world average. Norway has the largest surplus, thanks to oil and gas revenues that it saves rather than spends.
- Net debt in the UK is also higher than the average of other industrial countries.
